Signature Date
Acknowledgement

I wish to thank all the people who gave me advice and support during this research endeavour.

I would like to thank all the educators at my school for the support and encouragement they gave me, especially my principal, who gave me the permission to exercise my research activities at this school.

My sincere gratitude goes to my Physical Science learners, especially my 2004 Grade 10 learners who participated actively during my exploratory study, and my 2005 Grade 10 learners who also worked very hard during the execution of activities during this research study.

My sincere gratitude also goes to the elders in the community where I work, especially the ones I interviewed in 2004 (nine elders) and 2005 (eleven elders). They willingly shared their views and beliefs about lightning.

My special thanks goes to my thesis supervisor, Professor Peter Dekkers, for all the support and guidance he provided throughout the entire journey.

Lastly, I would like to thank the National Research Foundation (NRF) for their financial assistance.
Abstract

This research study was carried out to explore the integration of Indigenous Knowledge Systems with a science topic, as advocated by the South African policy document called the National Curriculum Statement.

The focus was on the integration of Indigenous Beliefs about lightning with the teaching of Static Electricity. The sample consisted of all my grade 10 learners who are eleven in number and one elder per learner, thus a sample of 22 people was made use of. The research process took place in two phases: the Baseline Study and the Teaching and Learning Process. The intention was to use data collected in the first phase to design the teaching and learning activities in the second phase. A series of four lessons was designed, and a variety of qualitative methods were used to collect data: interviews, questionnaires, and constructivist techniques.

The findings presented in this research study are based on an analysis of four videotaped lessons and learners’ responses from the worksheets and evaluation forms. These findings suggest that for maximum results, the integration of Indigenous Knowledge Systems should be an ongoing process.
